

Medical PA Criteria Document

Medical Procedure Class:	CT of Cervical Spine
Date:	May 1, 2007
Updated:	January 1, 2008

Executive Summary

Purpose:	To identify and discourage the inappropriate use of high tech, high cost diagnostic imaging.	
Why was this Issue Selected:	<p>The indiscriminate use of expensive imaging procedures for common and uncomplicated clinical presentations of the back and spine, e.g. chronic neck pain, have contributed to the perception of low value from these studies and to the high costs in managing these conditions.</p> <p>Patients with normal radiograph results (plain film X-rays) and no neurologic signs or symptoms will usually require no further imaging. However, patients with normal radiographic result and positive neurologic signs or symptoms may require CT imaging.</p>	
Procedures subject to Pre-Certification	<ul style="list-style-type: none">• 72125 Computed tomography, cervical spine; without contrast material• 72126 Computed tomography, cervical spine; with contrast material• 72127 Computed tomography, cervical spine; without contrast material, followed by contrast material(s) and further sections	
Setting & Population:	All Medicaid fee-for-service patients	
Type of Criteria:	<input type="checkbox"/> Increased risk of ADE <input checked="" type="checkbox"/> Appropriate Indications	<input type="checkbox"/> Non-Preferred Agent <input type="checkbox"/>

Setting & Population

- Procedure Group for review: CT of Cervical Spine
- Common Diagnostic Indications: Pain, radiculopathy, new or progressive neurologic symptoms or deficits.
- Considerations: Unless contraindicated, MRI is the preferred modality for most cervical spine imaging over CT, except for a few indications such as evaluation of suspected fracture or fracture follow-up.
- Age range: All patients

Approval Criteria

Patients with any of the following diagnostic indications for CT of the Cervical Spine, which may include supporting clinical information:

- Persistent pain or radiculopathy, with > 6 weeks of conservative therapy and inadequate response to treatment
- New or progressive neurologic symptoms or deficits, e.g. motor or sensory loss attributable to cervical pathology
- Signs or symptoms of spinal cord or nerve root compression, e.g. from disc herniation or spinal stenosis
- Multiple Sclerosis or other demyelinating diseases or myelopathies
- Infectious or inflammatory processes
- Possible spinal cord injury and post-traumatic neurologic deficit
- Post-operative evaluation, with new neurologic findings
- Tumor evaluation, for suspected or documented lesions
- Fracture evaluation for suspected or known fracture

Approval Diagnoses (Appendix A)

Condition	Submitted ICD-9 Diagnoses	CPT	Date Range	
Persistent pain or radiculopathy with > 6 weeks of conservative therapy and inadequate response to treatment.	720.0 - 724.9, 729.2, 781 - 781.99, 782	61055, 62310, 97530, 97810 - 87814, 98925 - 98929, 98940 - 98942	12 months	
New or progressive neurologic symptoms or deficits (motor/sensory loss) attributable to Cervical spine pathology	720.0 - 724.9, 729.2, 781 - 781.99, 782	NA	12 months	
Signs or symptoms of spinal cord or nerve root compression (disc herniation/spinal stenosis)	720.0 - 724.9, 729.2, 781 - 781.99, 782	NA	12 months	
Multiple sclerosis or other demyelinating diseases or myelopathies	340, 341 - 341.9	NA	12 months	

Infectious or inflammatory processes	730.9	NA	12 months	
Possible spinal cord injury and post-traumatic neurologic deficit	952 - 952.09, 952.8, 952.9	NA	12 months	
Post-operative evaluation, with new neurologic findings	720.0 - 724.9, 729.2, 781 - 781.99, 782	NA	12 months	
Tumor evaluation, for suspected or documented lesions	170, 192.2, 192.3, 192.8, 192.9, 198.3, 198.4, 213.2, 225.3, 225.4, 225.8, 225.9, 237.5	NA	12 months	
Fracture evaluation, for suspected or known fracture	805 - 805.18, 806.0 - 806.19	NA	12 months	

Denial Criteria

Patients without any of the above diagnostic indications for CT of the Cervical Spine. Some of these requested exams may be approvable upon the submission of appropriate supporting clinical information.

- For patients with chronic neck pain and the absence of neurologic signs and symptoms, plain radiographs should usually be the initial study performed in their evaluation
- Has not had a Cervical Spine X-ray in the last 60 days
- Have had a CT or MRI of the Cervical Spine in the last 180 days
